A wide variety of end sections are available which may be used with any culvert installation. Some sections eliminate the need for any cast in place concrete.

Doweled End - for steel dowels, 1” dia. by 12” deep doweled holes. When additional concrete must be poured beyond the precast sections.

Keyway Slot - a shear connection between the precast and field cast can be obtained by using a keyway slot around the periphery of the end precast sections.

Plain End - this section can be used as the end of an installation when the wing and end walls are designed to act independently of the precast box.
